

Power BI Adoption Framework

Inviso's Power BI Adoption Framework Engagement will help you build a robust foundation for sustainable Power BI governance and administration.

Inviso leverages Microsoft's Power BI Adoption Framework (PBIAF) to provide our clients with an understanding of various aspects of adoption and governance, including a structured approach for driving adoption of self-service BI.

Whether you are just getting started with Power BI, are migrating from another analytics platform, or have an existing Power BI implementation that has become difficult to manage, we can help you define and establish best practices to optimize your implementation for performance, scalability, security, usability, aesthetics, and more. If you are an existing Power BI customer, this will include a review of your existing data connections, data models, DAX statements, report layouts, visualizations, and approach to security and publishing.

Deliverables

Power BI Adoption Framework

The PBIAF is Microsoft's best practices approach to Power BI adoption, administration, and governance. We start with Microsoft's PBIAF template and then work with your team to customize it for your business needs, infrastructure, and areas of interest. The result is a document that your team can reference to ensure that best practices are followed for new builds, deployments, version control, security, sharing, and more.

Power BI Adoption Roadmap

Throughout this engagement, Inviso will document our recommendations on next steps. This will include short-term tactical recommendations within the context of longer-term roadmap goals. If desired, Inviso will also provide a proposal and estimates for implementation of next steps.

PBIAF Workshop(s)

After working with your stakeholders to customize and finalize your Power BI Adoption Framework document, Inviso will host interactive workshops with your team to demonstrate and socialize best practices and answer questions.
