

Strengthening endpoint security with Microsoft Defender for Endpoint

A highly regulated organization takes a cloud-first approach to IT. Security has been at the forefront of their cloud adoption, and Inviso helped reinforce endpoint protection.

Challenge

Facing a cybersecurity insurance policy renewal with growing requirements from their insurance provider, the highly regulated firm contacted Inviso to ensure their security capabilities meet or exceed all requirements. They had identified threat and vulnerability management for endpoints as a critical area for enhanced security.

Solution

Inviso collaborated with the client to help them deploy Microsoft Defender for Endpoint.

We worked with their team to determine the most efficient deployment method for onboarding remote Windows 10/11 endpoint devices, completed the initial **setup and configuration of Microsoft Defender for Endpoint**, and provided the team an orientation on the Microsoft 365 Defender Portal.

From there, Inviso **completed the production rollout after a successful pilot.**

Results

Microsoft Defender for Endpoint is now in place, providing their team with **near real-time visibility and oversight of their Windows 10/11 endpoints**. Their team now has a central threat and vulnerability management platform for their remote workforce.

Their insurance requirement is fulfilled, **endpoint security capabilities are strengthened**, and Inviso was able to help refine the client's security roadmap to continue strengthening their security posture via powerful, cloud-based technologies.
